Definition of Neural Network

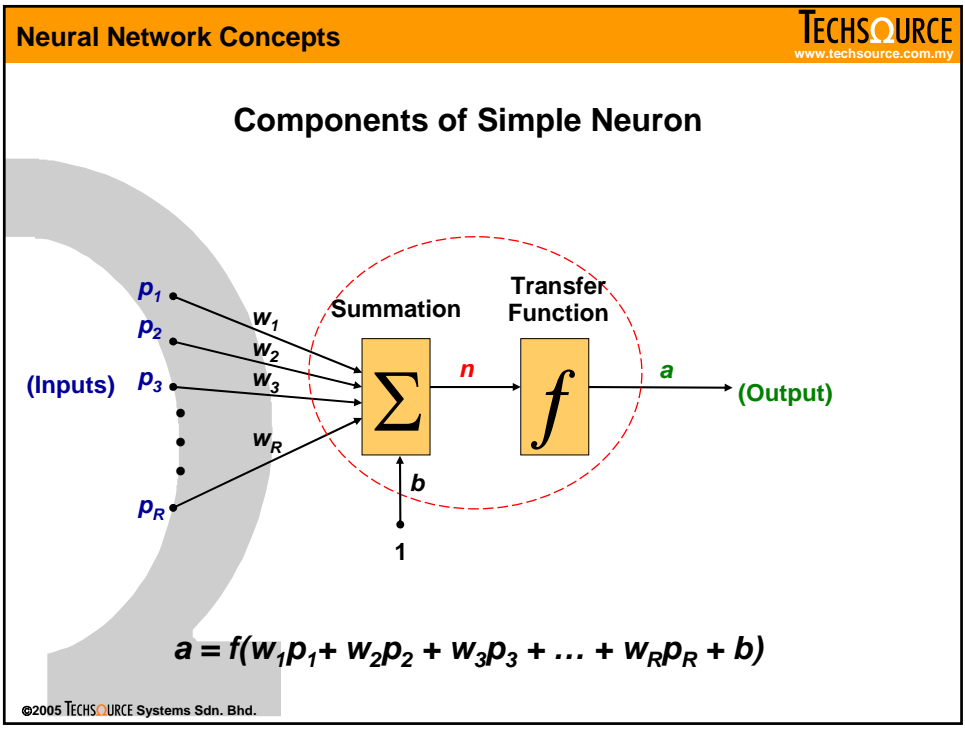

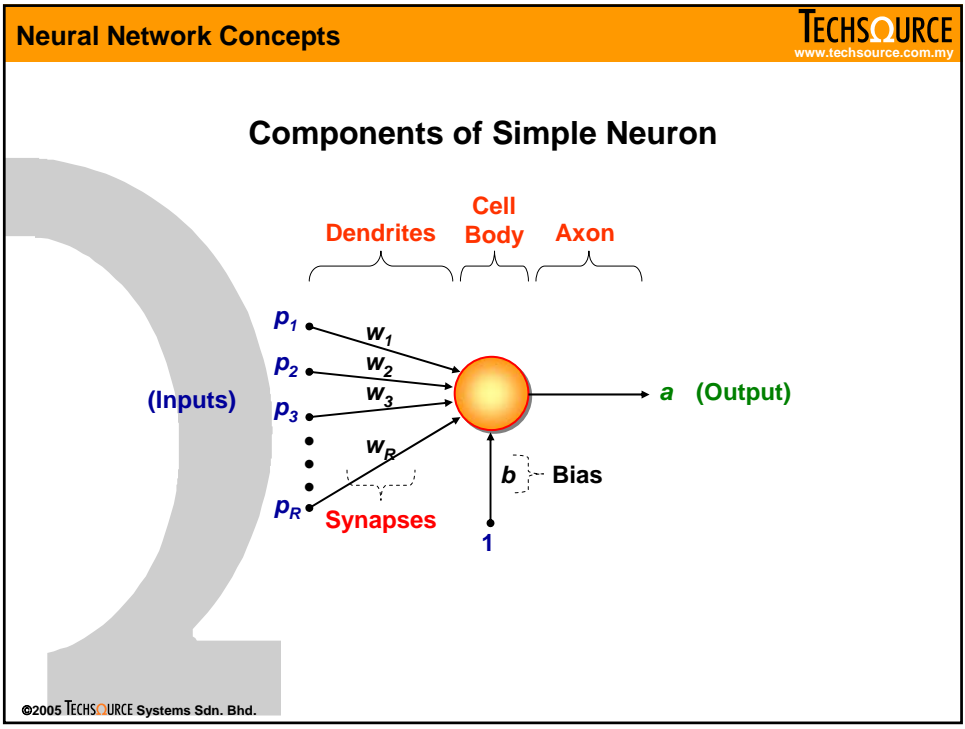

“A neural network is an **interconnected** assembly of simple processing elements, **units or nodes**, whose functionality is loosely based on the animal neuron. The processing ability of the network is stored in the inter-unit connection strengths, or **weights**, obtained by a process of adaptation to, or **learning** from, a set of training patterns.”

Neural Network Concepts

Example:

If $p_1 = 2.5$; $p_2 = 3$; $w_1 = 0.5$; $w_2 = -0.7$; $b = 0.3$. Let's assume the transfer function of the neuron is *hardlimit*, where,

$$a = \text{hardlim}(n) = \begin{cases} 0 & \text{for } n < 0 \\ 1 & \text{for } n \geq 0 \end{cases}$$

$\therefore a = \text{hardlim}(n) = \text{hardlim}(w_1 p_1 + w_2 p_2 + b)$
 $= \text{hardlim}(0.5 \times 2.5 + (-0.7) \times 3 + 0.3)$
 $= \text{hardlim}(-0.55)$
 $= 0$

Types of Neural Network TECHSOURCE
www.techsource.com.my

Perceptrons

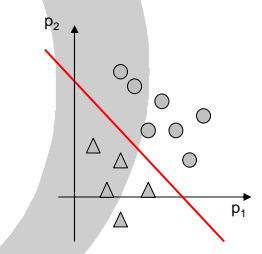

- Invented in 1957 by Frank Rosenblatt at Cornell Aeronautical Laboratory.
- The perceptron consists of a single-layer of neurons whose weights and biases could be *trained* to produce a correct target vector when presented with corresponding input vector.
- The output from a single perceptron neuron can only be in one of the two states. If the weighted sum of its inputs exceeds a certain threshold, the neuron will *fire* by outputting 1; otherwise the neuron will output either 0 or -1, depending on the transfer function used.
- The perceptron can only solve *linearly separable* problems.

©2005 TECHSOURCE Systems Sdn. Bhd.

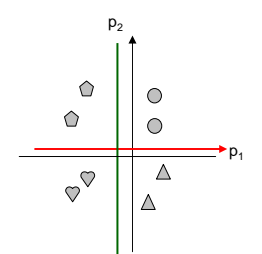

Types of Neural Network **TECHSOURCE**
www.techsource.com.my

Linearly Separable Problems

- If a *straight* line can be drawn to separate the input vectors into two categories, the input vectors are linearly separable, as illustrated in the diagram below. If need to identify four categories, we need to use two perceptron neurons.

(a) Two categories of input vectors

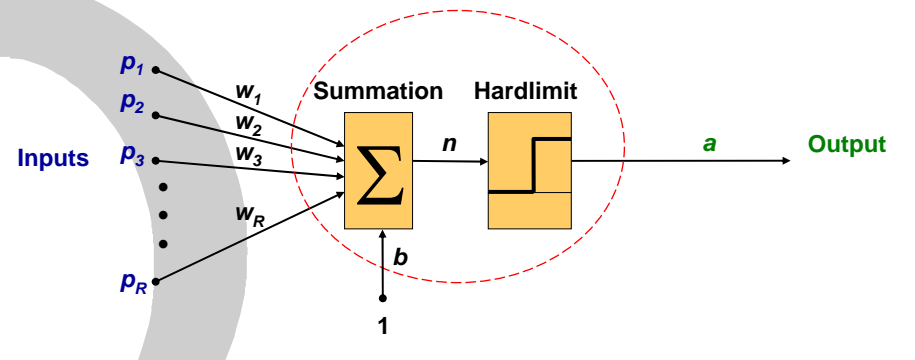

(b) Four categories of input vectors

Types of Neural Network

Creating a Perceptron: Command-Line Approach

The example below illustrates how to create a two-input, single-output perceptron. The input values range from -2 to 2.

```

% Creating a perceptron
>> net = newp([-2 2; -2 2], 1);

% Checking properties and values of Input Weights
>> net.inputWeights{1,1} % properties
>> net.IW{1,1} % values
    
```

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network

```

% Checking properties and values of bias
>> net.biases{1} % properties
>> net.b{1} % values

% Note that initial weights and biases are initialized to zeros using "initzero"
>> net.inputWeights{1,1}.initFcn
>> net.biases{1}.initFcn

% To compute the output of perceptron from input vectors [p1; p2], use the
"sim" command
>> p = [ 2; 2] [1; -2] [-2; 2] [-1; 1]
>> a = sim(net, p)
>> a =
    1    1    1    1
    
```

©2005 TECHSOURCE Systems Sdn. Bhd.

The Perceptron Learning Rule

- Perceptrons are trained on examples of desired behavior, which can be summarized by a set of input-output pairs

$$\{p_1, t_1\}, \{p_2, t_2\}, \dots, \{p_Q, t_Q\}$$

- The objective of training is to reduce the error e , which is the difference $t - a$ between the perceptron output a , and the target vector t .
- This is done by adjusting the *weights* (W) and *biases* (b) of the perceptron network according to following equations

$$W^{new} = W^{old} + \Delta W = W^{old} + ep^T$$

$$b^{new} = b^{old} + \Delta b = b^{old} + e$$

Where $e = t - a$

Training of Perceptron

- If the Perceptron Learning Rule is used repeatedly to adjust the weights and biases according to the error e , the perceptron will eventually find weight and bias values that solve the problem, given that the perceptron *can* solve it.
- Each traverse through all the training vectors is called an *epoch*.
- The process that carries out such a loop of calculation is called *training*.

Types of Neural Network TECHSOURCE
www.techsource.com.my

Example:

We can train a Perceptron network to classify two groups of data, as illustrated below

Data	x_1	x_2	Group
p_1	-3	-0.5	0
p_2	-2	-1.2	0
p_3	-1.5	0.7	1
p_4	-1	3	1
p_5	-1	-3.5	0
p_6	0	2	1
p_7	0	-2.5	0
p_8	1	0.7	1

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network TECHSOURCE
www.techsource.com.my

Procedures:

```

% Load the data points into Workspace
>> load data

% Assign training inputs and targets
>> p = points; % inputs
>> t = group; % targets

% Construct a two-input, single-output perceptron
>> net = newp(minmax(p), 1);

% Train the perceptron network with training inputs (p) and targets (t)
>> net = train(net, p, t)

% Simulate the perceptron network with same inputs again
>> a = sim(net, p)
>> a =
    0 0 1 1 0 1 0 1 % correct classification
>> t =
    0 0 1 1 0 1 0 1
    
```

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network TECHSOURCE
www.techsource.com.my

% Let's be more adventurous by querying the perceptron with inputs it never seen before

```

>> t1 = [-2; -3];
>> t2 = [0.5; 4];
>> a_t1 = sim(net, t1)
>> a_t1 =
    0
>> a_t2 = sim(net, t2)
>> a_t2 =
    1
∴ The perceptron classifies t1 and t2 correctly.
    
```

Using “nntool” GUI

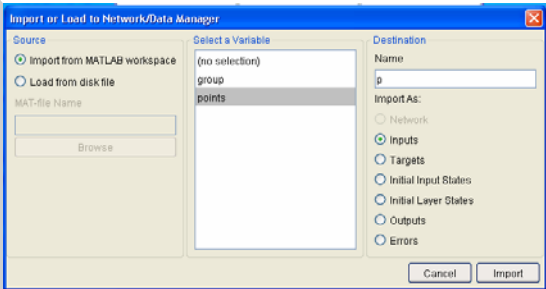

- The “nntool” GUI can be used to create and train different types of neural network available under MATLAB® Neural Network Toolbox
- The GUI can be invoked by typing at the command window, **>> nntool**

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network

TECHSOURCE
www.techsource.com.my

- First, define the training inputs by clicking **“Import...”**, select *group* from the list of variables. Assign a *name* to the inputs and indicate that this variable should be imported as *inputs*.
- Define the targets similarly.

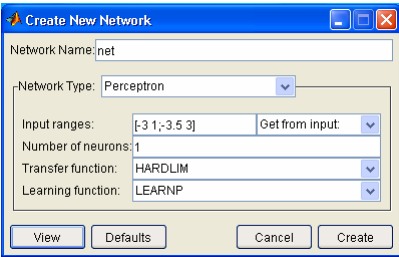

- Create a new perceptron network by clicking **“New Network...”**, a new window appears where network architecture can be defined. Click **“Create”** to create the network.

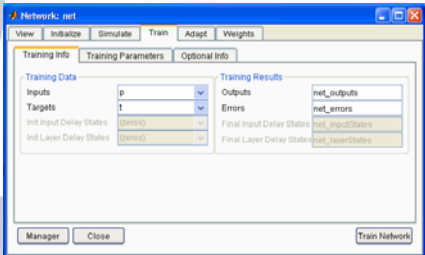

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network

TECHSOURCE
www.techsource.com.my

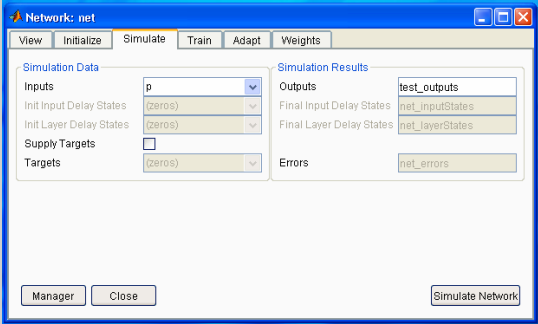

- Next, select the **“Train...”** tab and set Inputs to *p* and Targets to *t*. Click on **“Train Network”** to start the training.

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network TECHSOURCE
www.techsource.com.my

- The network completed training in 4 epochs, which is 4 complete passes through all training inputs.
- Now, we can test the performance of the trained network by clicking "Simulate...". Set the Inputs to *p*.

Types of Neural Network TECHSOURCE
www.techsource.com.my

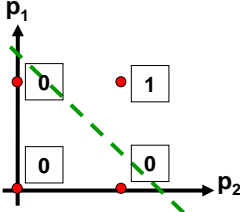

Exercise 1: Modeling Logical AND Function

The Boolean AND function has the following truth table:

X	Y	X AND Y
0	0	0
0	1	0
1	0	0
1	1	1

The problem is linearly-separable, try to build a one-neuron perceptron network with following inputs and output:

p_1	p_2	a
0	0	0
0	1	0
1	0	0
1	1	1

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network **TECHSOURCE**
www.techsource.com.my

Solution:

Command-line approach is demonstrated herein. The "nntool" GUI can be used alternatively.

```
% Define at the MATLAB® command window, the training inputs and targets
>> p = [0 0 1 1; 0 1 0 1]; % training inputs, p = [p1; p2]
>> t = [0 0 0 1]; % targets

% Create the perceptron
>> net = newp([0 1; 0 1], 1);

% Train the perceptron with p and t
>> net = train(net, p, t);

% To test the performance, simulate the perceptron with p
>> a = sim(net, p)
>> a =
    0 0 0 1
>> t =
    0 0 0 1
```

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network **TECHSOURCE**
www.techsource.com.my

Exercise 2: Pattern Classification

Build a perceptron that can differentiate between two group of images:

Group 0

0	1	0
1	0	1
1	0	1
0	1	0

img1

Group 1

0	1	0
1	0	1
1	0	1
0	1	0

img2

img3

0	1	0
1	0	1
1	0	1
0	1	0

img4

Hint:

Use Boolean values 1's and 0's to represent the image.

Example for image_1 is shown.

$$\therefore \text{image_1} = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 1 \\ 1 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix};$$

Load the training vectors into workspace:

```
>> load train_images
```

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network

Try testing the trained perceptron on following images:

timg1

timg2

timg3

```
>> load test_images
```

Types of Neural Network

Solution:

Command-line approach is demonstrated herein. The "nntool" GUI can be used alternatively.

```
% Define at the MATLAB® command window, the training inputs and targets
```

```
>> load train_images
```

```
>> p = [img1 img2 img3 img4];
```

```
>> t = targets;
```

```
% Create the perceptron
```

```
>> net = newp(minmax(p), 1);
```

```
% Training the perceptron
```

```
>> net = train(net, p, t);
```

```
% Testing the performance of the trained perceptron
```

```
>> a = sim(net, p)
```

```
% Load the test images and ask the perceptron to classify it
```

```
>> load test_images
```

```
>> test1 = sim(net, timg1) % to do similarly for other test images
```

Types of Neural Network TECHSOURCE
www.techsource.com.my

Linear Networks

- Linear networks are similar to perceptron, but their transfer function is linear rather than hard-limiting.
- Therefore, the output of a linear neuron is not limited to 0 or 1.
- Similar to perceptron, linear network can only solve *linearly separable* problems.
- Common applications of linear networks are linear classification and adaptive filtering.

©2005 TECHSOURCE Systems Sdn. Bhd.

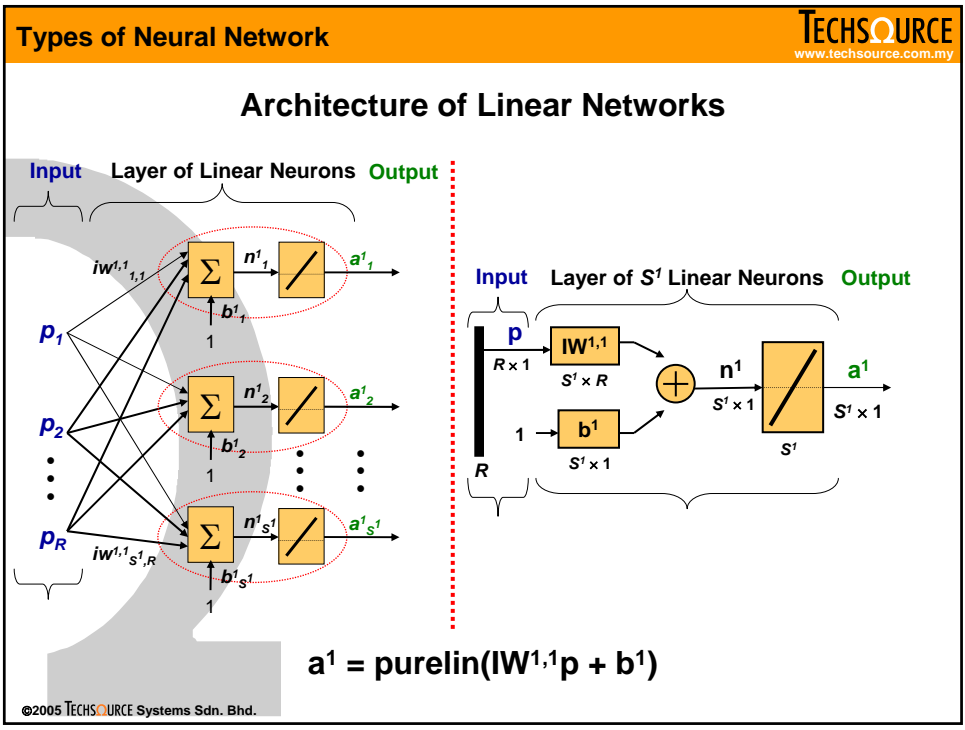

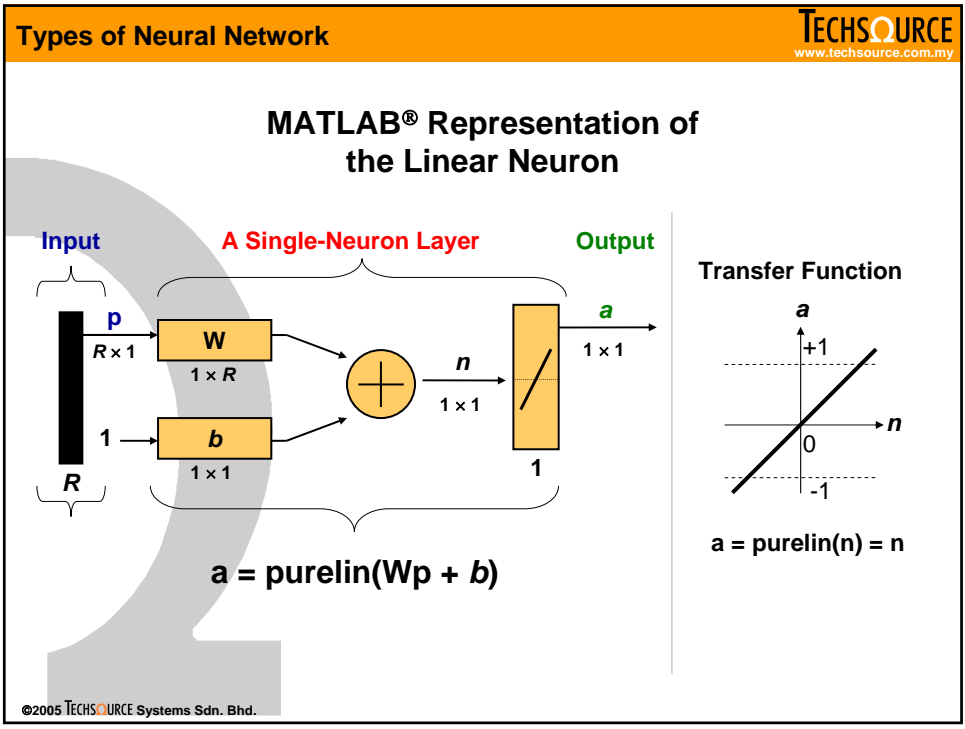

Types of Neural Network TECHSOURCE
www.techsource.com.my

The Linear Neuron

The diagram illustrates the internal structure of a linear neuron. On the left, a vertical list of inputs $p_1, p_2, p_3, \dots, p_R$ is shown. Each input p_i is connected to a corresponding weight w_i . These weighted inputs, along with a bias b from a constant input of 1, are fed into a 'Summation' block (represented by a yellow box with a Σ symbol). The output of the summation block is labeled n . This value n is then passed to a 'Linear' transfer function block (represented by a yellow box with a diagonal line). The final output of the neuron is labeled a .

$$a = \text{purelin}(w_1p_1 + w_2p_2 + w_3p_3 + \dots + w_Rp_R + b)$$

Types of Neural Network **TECHSOURCE**
www.techsource.com.my

```

% Checking properties and values of bias
>> net.biases{1} % properties
>> net.b{1} % values

% Note that initial weights and biases are initialized to zeros using "initzero"
>> net.inputWeights{1,1}.initFcn
>> net.biases{1}.initFcn

% To compute the output of linear network from input vectors [p1; p2], use
the "sim" command
>> p = [ 2; 2] [1; -2] [-2; 2] [-1; 1]
>> a = sim(net, p)
>> a =
    0  0  0  0
    
```

©2005 TECHSOURCE Systems Sdn. Bhd.

The Widrow-Hoff Learning Algorithm

- Similar to perceptron, the Least Mean Square (LMS) algorithm, alternatively known as the Widrow-Hoff algorithm, is an example of supervised training based on a set of training examples.

$$\{p_1, t_1\}, \{p_2, t_2\}, \dots, \{p_Q, t_Q\}$$

- The LMS algorithm adjusts the weights and biases of the linear networks to minimize the mean square error (MSE)

$$MSE = \frac{1}{Q} \sum_{k=1}^Q e(k)^2 = \frac{1}{Q} \sum_{k=1}^Q (t(k) - a(k))^2$$

- The LMS algorithm adjusts the weights and biases according to following equations

$$W(k+1) = W(k) + 2\alpha e(k)pT(k)$$

$$b(k+1) = b(k) + 2\alpha e(k)$$

Linear Classification (train)

- Linear networks can be trained to perform linear classification with the function **train**.
- The **train** function applies each vector of a set of input vectors and calculates the network weight and bias increments due to each of the inputs according to the LMS (Widrow-Hoff) algorithm.
- The network is then adjusted with the sum of all these corrections.
- A pass through all input vectors is called an *epoch*.

Types of Neural Network **TECHSOURCE**
www.techsource.com.my

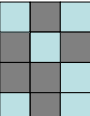

Example:
Let's re-visit **Exercise 2: Pattern Classification of the Perceptrons**.
We can build a Linear Network to perform not only pattern *classification* but also *association* tasks.

Training Images

Group 0

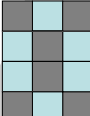

0	1	0
1	0	1
1	0	1
0	1	0

Types of Neural Network **TECHSOURCE**
www.techsource.com.my

Solution:
Command-line approach is demonstrated herein. The "nntool" GUI can be used alternatively.

```

% Define at the MATLAB® command window, the training inputs and targets
>> load train_images
>> p = [img1 img2 img3 img4];
>> t = targets;

% Create the linear network
>> net = newlin(minmax(p), 1);

% Train the linear network
>> net.trainParam.goal = 10e-5; % training stops if goal achieved
>> net.trainParam.epochs = 500; % training stops if epochs reached
>> net = train(net, p, t);

% Testing the performance of the trained linear network
>> a = sim(net, p)
>> a =
    -0.0136    0.9959    0.0137    1.0030
    
```

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network **TECHSOURCE**
www.techsource.com.my

```

% Comparing actual network output, a, with training targets, t:
>> a =
    -0.0136    0.9959    0.0137    1.0030
>> t =
         0         1         0         1
    
```

∴ The actual network output, a, closely resembles that of target, t. It is because the output from Linear Network is not straightly 0 or 1, the output can be a range of values.

```

% Now, test the Linear Network with 3 images not seen previously
>> load test_images
>> test1 = sim(net, timg1)
>> test1 =
    0.2271
>> test2 = sim(net, timg2)
>> test2 =
    0.9686
>> test3 = sim(net, timg3)
test3 =
    0.8331
    
```

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network **TECHSOURCE**
www.techsource.com.my

How should we interpret the network outputs `test1`, `test2` and `test3`? For that we need to define a Similarity Measure, S

$$S = |t - test|$$

Where `t` is the target-group (i.e. 0 or 1) and `test` is the network output when presented with test images.

The smaller the `S` is, the more similar is a test image to a particular group.

Similarity Measure, S		
test image	wrt. Group 0	wrt. Group 1
timg1	0.2271	0.7729
timg2	0.9686	0.0314
timg3	0.8331	0.1669

∴ `timg1` belongs to Group 0 while `timg2` and `timg3` belong to Group 1.

These results are similar to what we obtained previously using Perceptron. By using Linear Network we have the added advantage of knowing how *similar* is it a test image is to the target group it belonged.

Types of Neural Network

Backpropagation (BP) Networks

- Backpropagation network was created by generalizing the Widrow-Hoff learning rule to *multiple-layer* networks and *non-linear differentiable* transfer functions (TFs).
- Backpropagation network with biases, a sigmoid TF layer, and a linear TF output layer is capable of approximating *any* function.
- Weights and biases are updated using a variety of gradient descent algorithms. The gradient is determined by propagating the computation *backwards* from output layer to first hidden layer.
- If properly trained, the backpropagation network is able to generalize to produce reasonable outputs on inputs it has never “seen”, as long as the new inputs are *similar* to the training inputs.

Types of Neural Network

The Backpropagation Algorithm

- The backpropagation algorithm is used to update the weights and biases of the neural networks. Full details of the algorithm is given in Appendix 1.
- The weights are updated according to following formulae:

$$w_{j,i} \leftarrow w_{j,i} + \Delta w_{j,i} \quad \text{where,} \quad \Delta w_{j,i} = -\alpha \frac{\partial E}{\partial w_{j,i}} = -\alpha \delta_j x_{j,i}$$

For output neuron k ,

$$\delta_k = -a_k (1 - a_k) (t_k - a_k)$$

For hidden neuron h ,

$$\delta_h = a_h (1 - a_h) \sum_{k \in \text{Downstream}(h)} \delta_k w_{k,h}$$

Please see Appendix 1 for full derivation of the algorithm

©2005 TECHSOURCE Systems Sdn. Bhd.

Training of Backpropagation Networks

- There are generally four steps in the training process:
 1. Assemble the training data;
 2. Create the network object;
 3. Train the network;
 4. Simulate the network response to new inputs.
- The MATLAB® Neural Network Toolbox implements some of the most popular training algorithms, which encompass both original gradient-descent and faster training methods.

Batch Gradient Descent Training

- **Batch Training:** the weights and biases of the network are updated only after the entire training data has been applied to the network.
- **Batch Gradient Descent (`traingd`):**
 - Original but the slowest;
 - Weights and biases updated in the direction of the negative gradient (note: backprop. algorithm);
 - Selected by setting `trainFcn` to `traingd`:

```
net = newff(minmax(p), [3 1], {'tansig', 'purelin'}, 'traingd');
```

Batch Gradient Descent with Momentum

- Batch Gradient Descent with Momentum (**traingdm**):
 - Faster convergence than **traingd**;
 - Momentum allows the network to respond not only the local gradient, but also to recent trends in the error surface;
 - Momentum allows the network to ignore small features in the error surface; without momentum a network may get stuck in a shallow local minimum.
 - Selected by setting **trainFcn** to **traingdm**:

```
net = newff(minmax(p), [3 1], {'tansig', 'purelin'}, 'traingdm');
```

Faster Training

- The MATLAB® Neural Network Toolbox also implements some of the faster training methods, in which the training can converge from ten to one hundred times faster than **traingd** and **traingdm**.
- These faster algorithms fall into two categories:
 1. Heuristic techniques: developed from the analysis of the performance of the standard gradient descent algorithm, e.g. **traingda**, **traingdx** and **trainrp**.
 2. Numerical optimization techniques: make use of the standard optimization techniques, e.g. conjugate gradient (**traingcf**, **traingcb**, **traingcp**, **traingcg**), quasi-Newton (**trainbfg**, **trainoss**), and Levenberg-Marquardt (**trainlm**).

Types of Neural Network		TECHSOURCE www.techsource.com.my
Comparison of Training Algorithms		
Training Algorithms	Comments	
traingd	Gradient Descent (GD)	Original but slowest
traingdm	GD with momentum	Faster than traingd
traingda	GD with adaptive α	Faster than traingd , but can use for batch mode only.
traingdx	GD with adaptive α and with momentum	
trainrp	Resilient Backpropagation	Fast convergence
traingcf	Fletcher-Reeves Update	Conjugate Gradient Algorithms with fast convergence
traingcp	Polak-Ribière Update	
traingcb	Powell-Beale Restarts	
traingcg	Scaled Conjugate Gradient	
trainbfg	BFGS algorithm	Quasi-Newton Algorithms with fast convergence
trainoss	One Step Secant algorithm	
trainlm	Levenberg-Marquardt	Fastest training. Memory reduction features
trainbr	Bayesian regularization	Improve generalization capability

Example: Modeling Logical XOR Function

The XOR Problem is highly non-linear, thereby cannot be solved using Perceptrons or Linear Networks. In this example, we will construct a simple backpropagation network to solve this problem.

X	Y	X XOR Y
0	0	0
0	1	1
1	0	1
1	1	0

p ₁	p ₂	a
0	0	0
0	1	0
1	0	0
1	1	1

Types of Neural Network **TECHSOURCE**
www.techsource.com.my

Solution:

Command-line approach is demonstrated herein. The "nntool" GUI can be used alternatively.

```

% Define at the MATLAB® command window, the training inputs and targets
>> p = [0 0 1 1; 0 1 0 1];
>> t = [0 0 0 1];

% Create the backpropagation network
>> net = newff(minmax(p), [4 1], {'logsig', 'logsig'}, 'traingdx');

% Train the backpropagation network
>> net.trainParam.epochs = 500; % training stops if epochs reached
>> net.trainParam.show = 1; % plot the performance function at every epoch
>> net = train(net, p, t);

% Testing the performance of the trained backpropagation network
>> a = sim(net, p)
>> a =
    0.0002  0.0011  0.0001  0.9985
>> t =
    0    0    0    1
    
```

©2005 TECHSOURCE Systems Sdn. Bhd.

Improving Generalization with Early Stopping

- The generalization capability can be improved with the *early stopping* feature available with the Neural Network toolbox.
- In this technique the available data is divided into three subsets:
 1. Training set
 2. Validation set
 3. Testing set
- The *early stopping* feature can be invoked when using the **train** command:

```
[net, tr] = train(net, p, t, [], [], VV, TV)
```

VV: Validation set structure; TV: Test set structure.

Example: Function Approximation with Early Stopping

% Define at the MATLAB® command window, the training inputs and targets

```
>> p = [-1: 0.05: 1];  
>> t = sin(2*pi*p) + 0.1*randn(size(p));
```

% Construct Validation set

```
>> val.P = [-0.975: 0.05: 0.975]; % validation set must be in structure form  
>> val.T = sin(2*pi*val.P) + 0.1*randn(size(val.P));
```

% Construct Test set (optional)

```
>> test.P = [-1.025: 0.05: 1.025]; % validation set must be in structure form  
>> test.T = sin(2*pi*test.P) + 0.1*randn(size(test.P));
```

% Plot and compare three data sets

```
>> plot(p, t), hold on, plot(val.P, val.T, 'r:*'), hold on, plot(test.P, test.T, 'k:^');  
>> legend('train', 'validate', 'test');
```

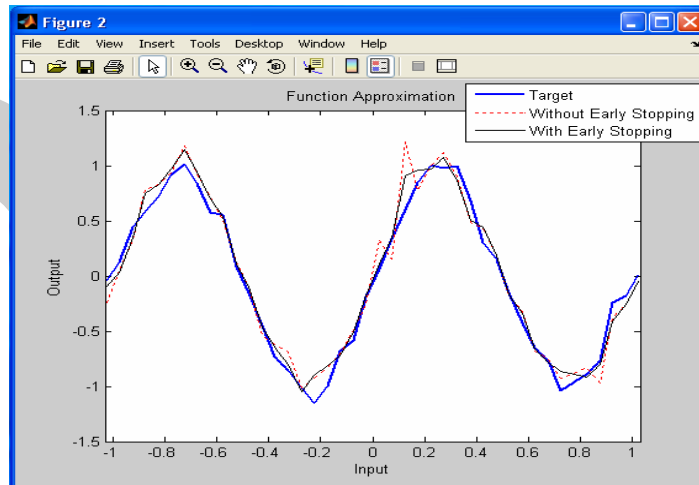

% Create a 1-20-1 backpropagation network with 'trainlm' algorithm

```
>> net = newff(minmax(p), [20 1], {'tansig', 'purelin'}, 'trainlm');
```

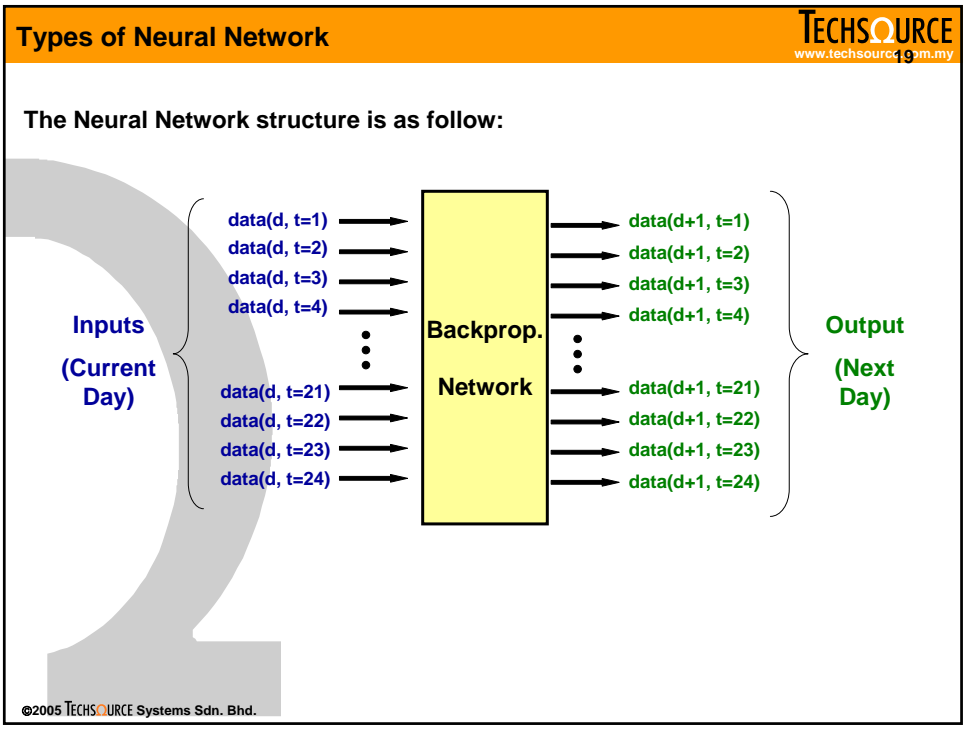

Types of Neural Network

```
>> net.trainParam.show = 1;  
>> net.trainParam.epochs = 300;  
  
% First, train the network without early stopping  
>> net = init(net); % initialize the network  
>> [net, tr] = train(net, p, t);  
>> net1 = net; % network without early stopping  
  
% Then, train the network with early stopping with both Validation & Test sets  
>> net = init(net);  
>> [net, tr] = train(net, p, t, [], [], val, test);  
>> net2 = net; % network with early stopping  
  
% Test the modeling performance of net1 & net2 on Test sets  
>> a1 = sim(net1, test.P); % simulate the response of net1  
>> a2 = sim(net2, test.P); % simulate the response of net2  
>> figure, plot(test.P, test.T), xlim([-1.03 1.03]), hold on  
>> plot(test.P, a1, 'r'), hold on, plot(test.P, a2, 'k');  
>> legend('Target', 'Without Early Stopping', 'With Early Stopping');
```

Types of Neural Network

∴ Network with *early stopping* can better fit the Test data set with less discrepancies, therefore the *early stopping* feature can be used to prevent *overfitting* of network towards the training data.

Types of Neural Network

Network details:

- Architecture: **24-48-24** network, with **tansig** TF and **purelin** TF in hidden and output layer respectively.
- Training: **trainlm** algorithm with **7** epochs and plot the performance function every **1** epoch.

Data details:

- Load **timeseries.mat** into MATLAB® workspace.
- Training Data (1st to 37th days): **TrainIp** (inputs), **TrainTgt** (targets)
- Testing Data (38th to 40th days): **TestIp** (query inputs), **TestTgt** (actual values)

Hint: use pre- and post-processing functions **premnmx**, **trmnmx**, **postmnmx** to have more efficient training.

Types of Neural Network

Solution:

```
% Load the Time Series data into MATLAB® Workspace
>> load timeseries

% Prepare the data for the network training
>> [PN, minp, maxp, TN, mint, maxt] = premnmx(TrainIp, TrainTgt);

% Create the backpropagation network
>> net = newff(minmax(PN), [48 24], {'tansig', 'purelin'}, 'trainlm');
>> net.trainParam.epochs = 7;
>> net.trainParam.show = 1;

% Training the neural network
>> [net, tr] = train(net, PN, TN);

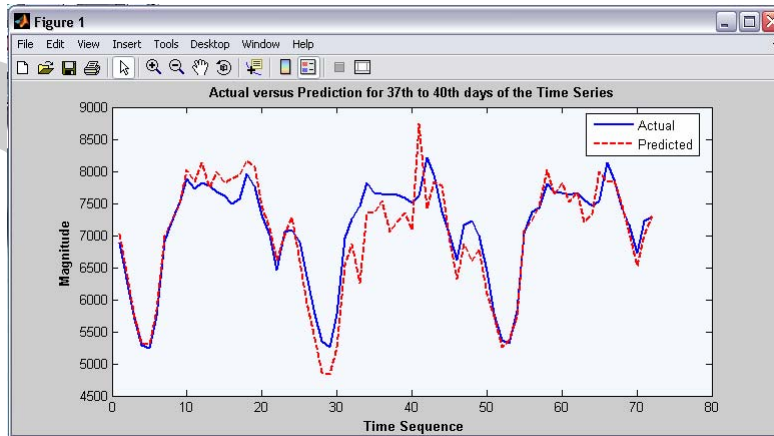

% Prepare the data for testing the network (predicting 38th to 40th days)
>> PN_Test = trmnmx(TestIp, minp, maxp);

% Testing the neural network
>> TN_Test = sim(net, PN_Test);
```

Types of Neural Network

```
% Convert the testing output into prediction values for comparison purpose  
>> [queryInputs predictOutputs] = postmnmx(PN_Test, minp, maxp, ...  
TN_Test, mint, maxt);  
  
% Plot and compare the predicted and actual time series  
>> predictedData = reshape(predictOutputs, 1, 72);  
>> actualData = reshape(TestTgt, 1, 72);  
>> plot(actualData, '-*'), hold on  
>> plot(predictOutputs, 'r:');
```

Types of Neural Network

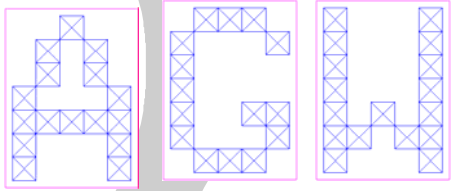

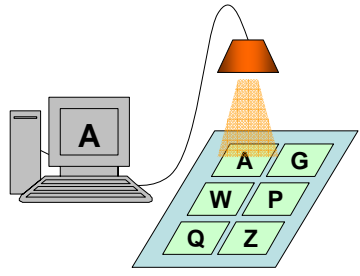

Homework: Try to subdivide the training data [TrainIp TrainTgt] into Training & Validation Sets to ascertain whether the use of *early stopping* would improve the prediction accuracy.

Types of Neural Network **TECHSOURCE**
www.techsource24.com.my

Exercise 2: Character Recognition

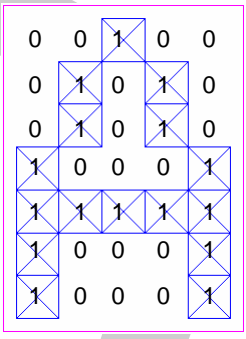

Create a Neural Network that can recognize 26 letters of the alphabet. An imaging system that digitizes each letter centered in the system field of vision is available. The result is each letter represented as a 7 by 5 grid of boolean values. For example, here are the Letters A, G and W:

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network **TECHSOURCE**
www.techsource25.com.my

➤ For each alphabetical letter, create a 35-by-1 input vector containing boolean values of 1's and 0's. Example for Letter A:

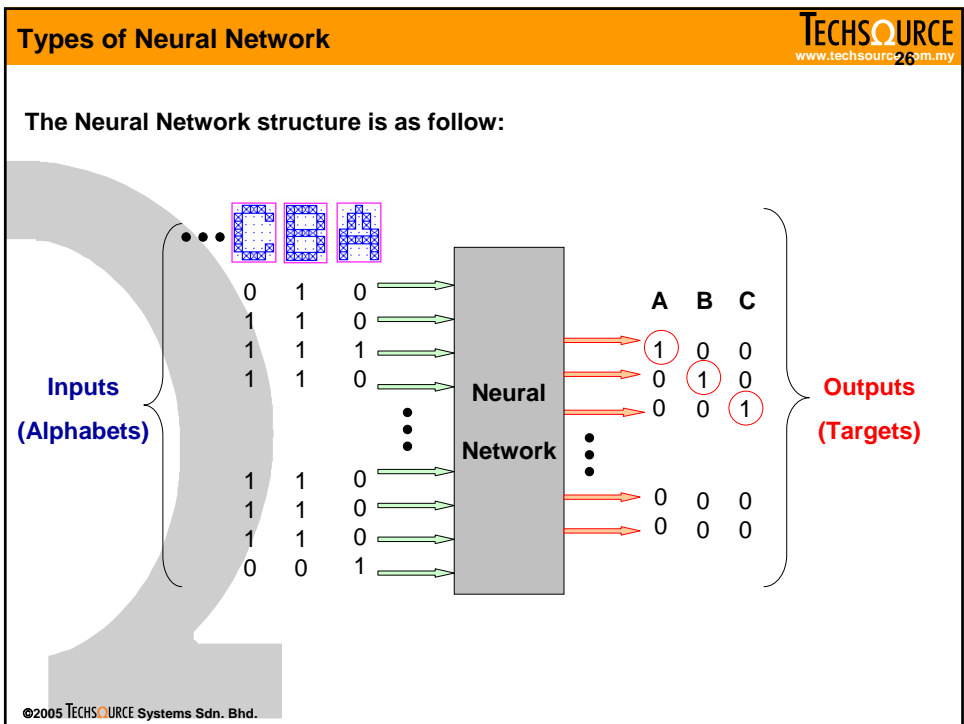

Letter A = [0 0 1 0 0 ...
0 1 0 1 0 ...
0 1 0 1 0 ...
1 0 0 1 ...
1 1 1 1 1 ...
1 0 0 1 ...
1 0 0 1];

Target A = [1 0 0 0 0 ...
0 0 0 0 0 ...
0 0 0 0 0 ...
0 0 0 0 0 ...
0 0 0 0 0 ...
0];

➤ Corresponding Output is a 26-by-1 vector, indicating a 1 (i.e. TRUE) at the correct alphabetical sequence. Example for Target A:

Network details:

- Architecture: 35-10-26 network, with **logsig** TFs in hidden and output layers.
- Training: **traingdx** algorithm with **500** epochs and plot the performance function every **1** epoch. Performance goal is **0.001**.

Data details:

- Load training inputs and targets into workspace by typing `[alphabets, targets] = prprob;`

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network

Solution:

```
% Load the training data into MATLAB® Workspace
>> [alphabets, targets] = prprob;

% Create the backpropagation network
>> net = newff(minmax(alphabets), [10 26], {'logsig', 'logsig'}, 'traingdx');
>> net.trainParam.epochs = 500;
>> net.trainParam.show = 1;
>> net.trainParam.goal = 0.001;

% Training the neural network
>> [net, tr] = train(net, alphabets, targets);

% First, we create a normal 'J' to test the network performance
>> J = alphabets(:,10);
>> figure, plotchar(J);
>> output = sim(net, J);
>> output = compet(output) % change the largest values to 1, the rest 0s
>> answer = find(compet(output) == 1); % find the index (out of 26) of network
output
>> figure, plotchar(alphabets(:, answer));
```

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network

```
% Next, we create a noisy 'J' to test the network can still identify it correctly...
>> noisyJ = alphabets(:,10)+randn(35,1)*0.2;
>> figure; plotchar(noisyJ);
>> output2 = sim(network1, noisyJ);
>> output2 = compet(output2);
>> answer2 = find(compet(output2) == 1);
>> figure; plotchar(alphabets(:,answer2));
```

Types of Neural Network TECHSOURCE
www.techsource.com.my

Self-Organizing Maps

- Self-organizing in networks is one of the most fascinating topics in the neural network field. Such networks can learn to detect *regularities* and *correlations* in their input and adapt their future responses to that input accordingly.
- The neurons of competitive networks learn to recognize groups of similar input vectors. Self-organizing maps learn to recognize groups of similar input vectors in such a way that neurons physically near each other in the neuron layer respond to similar input vectors.

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network TECHSOURCE
www.techsource.com.my

Learning Algorithms for Competitive Network

- The weights of the winning neuron (represented by a row of the input weight matrix) are adjusted with the *Kohonen learning rule* (**learnk**).
- Supposed that the i^{th} neuron wins, the elements of the i^{th} row of the input weight matrix are adjusted according to following formula:
$$iW^{1,1}(q) = iW^{1,1}(q-1) + \alpha(p(q) - iW^{1,1}(q-1))$$
- One of the limitations of the competitive networks is that some neurons may *never* wins because their weights are *far* from any input vectors.
- The bias learning rule (**learncon**) is used to allow every neuron in the network learning from the input vectors.

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network TECHSOURCE
www.techsource.com.my

Example: Classification using Competitive Network

We can use a competitive network to classify input vectors without any learning targets.

Let's say if we create four two-element input vectors, with two very close to (0 0) and others close to (1 1).

$p = [0.1 \ 0.8 \ 0.1 \ 0.9$
 $0.2 \ 0.9 \ 0.1 \ 0.8];$

Let's see whether the competitive network is able to identify the classification structure...

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network **TECHSOURCE**
www.techsource.com.my

```
% Define at the MATLAB® command window, the four two-element vectors
>> p = [0.1 0.8 0.1 0.9; 0.2 0.9 0.1 0.8];

% Create a two-neuron competitive network
>> net = newc([0 1; 0 1], 2);

% The weights are initialized to the center of input ranges with 'midpoint' fcn
>> net.IW{1,1}
ans =
    0.5    0.5
    0.5    0.5

% The biases are computed by 'initcon' fcn, which gives
>> net.b{1}
ans =
    5.4366
    5.4366

% Let's train the competitive network for 500 epochs
>> net.trainParam.epochs = 500;
>> net = train(net, p);
```

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network **TECHSOURCE**
www.techsource.com.my

```
% Simulate the network with input vectors again
>> a = sim(net, p)
>> ac = vec2ind(a)
>> ac =
    2    1    2    1

∴ The network is able to classify the input vectors into two classes, those who close to (1,1), class 1 and those close to origin (0,0), class 2. If we look at the adjusted weights,

>> net.IW{1,1}
ans =
    0.8500    0.8500
    0.1000    0.1501

∴ Note that the first-row weight vector (associated with 1st neuron) is near to input vectors close to (1,1), which the second-row weight vector (associated with 2nd neuron) is near to input vectors close to (0,0).
```

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network

Exercise 1: Classification of Input Vectors:

Graphical Example

First, generate the input vectors by using the built-in `nngenc` function:

```
>> X = [0 1; 0 1]; % Cluster centers to be in these bounds
>> clusters = 8; % Number of clusters
>> points = 10; % Number of points in each cluster
>> std_dev = 0.05; % Standard deviation of each cluster
>> P = nngenc(X,clusters,points,std_dev); % Number of clusters
```

Plot and show the generated clusters

```
>> plot(P(1,:),P(2:,:),'+r');
>> title('Input Vectors');
>> xlabel('p(1)');
>> ylabel('p(2)');
```

Try to build a competitive network with 8 neurons and train for 1000 epochs. Superimpose the trained network weights onto the same figure. Try to experiment with the number of neurons and conclude on the accuracy of the classification.

Types of Neural Network

Solution:

% Create and train the competitive network

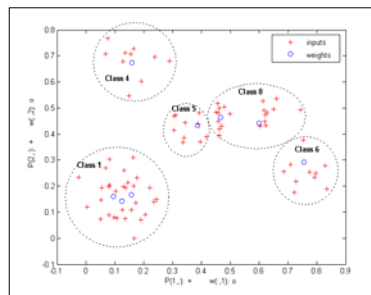

```
>> net = newc([0 1; 0 1], 8, 0.1); % Learning rate is set to 0.1
>> net.trainParam.epochs = 1000;
>> net = train(net, P);
```

% Plot and compare the input vectors and cluster centres determined by the competitive network

```
>> w = net.IW{1,1};
>> figure, plot(P(1,:),P(2:,:),'+r');
>> hold on, plot(w(:,1), w(:,2), 'ob');
```

% Simulate the trained network to new inputs

```
>> t1 = [0.1; 0.1], t2 = [0.35; 0.4], t3 = [0.8; 0.2];
>> a1 = sim(net, [t1 t2 t3]);
>> ac1 = vec2ind(a1);
ac1 =
    1    5    6
```

Homework: Try altering the number of neurons in the competitive layer and observe how it affects the cluster centres.

Self-Organizing Maps

- Similar to competitive neural networks, self-organizing maps (SOMs) can learn the *distribution* of the input vectors. The distinction between these two networks is that the SOM can also learn the *topology* of the input vectors.
- However, instead of updating the weight of the winning neuron i^* , all neurons within a certain neighborhood $N_{i^*}(d)$ of the winning neuron are also updated using the Kohonen learning *learnsom*, as follows:

$${}_i w(q) = {}_i w(q - 1) + \alpha(p(q) - {}_i w(q - 1))$$

- The neighborhood $N_{i^*}(d)$ contains the indices for all the neurons that lie within a radius d of the winning neuron i^* .

$$N_{i^*}(d) = \{j, d_{ij} \leq d\}$$

Topologies & Distance Functions

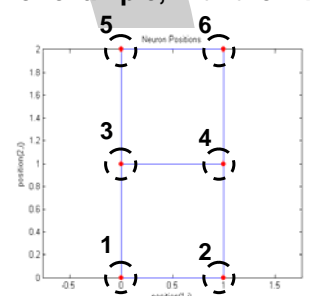

- Three different types of topology can be specified for the initial location of the neurons:
 1. Rectangular grid: *gridtop*
 2. Hexagonal grid: *hextop*
 3. Random grid: *randtop*
- For example, to create a 5-by-7 hexagonal grid,

```
>> pos = hextop(5,7);  
>> plotsom(pos);
```

Types of Neural Network TECHSOURCE
www.techsource.com.my

- Similarly, there are four different ways of calculating the distance from a particular neuron to its neighbors:
 - Euclidean distance: **dist**
 - Box distance: **boxdist**
 - Link distance: **linkdist**
 - Manhattan distance: **mandist**
- For example, with the 2-by-3 rectangular grid shown below,

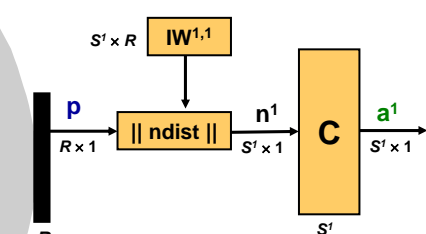

```
>> d = boxdist(pos)
d =
    0  1  1  1  2  2
    1  0  1  1  2  2
    1  1  0  1  1  1
    1  1  1  0  1  1
    2  2  1  1  0  1
    2  2  1  1  1  0
```

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network TECHSOURCE
www.techsource.com.my

The SOM Architecture

Input **Self-Organizing Map Layer** **Output**

$$n_i^1 = -||_i IW^{1,1} - p ||$$

$$a^1 = \text{compet}(n^1)$$

©2005 TECHSOURCE Systems Sdn. Bhd.

Creating and Training the SOM

- Let's load an input vector into MATLAB® workspace

```
>> load somdata
>> plot(P(1,:), P(2,:), 'g.', 'markersize', 20), hold on
```
- Create a 2-by-3 SOM with following command, and superimpose the initial weights onto the input space

```
>> net = newsom([0 2; 0 1], [2 3]);
>> plotsom(net.iw{1,1}, net.layers{1}.distances), hold off
```
- The weights of the SOM are updated using the `learnsom` function, where the winning neuron's weights are updated proportional to α and the weights of neurons in its neighbourhood are altered proportional to $\frac{1}{2}$ of α .

- The training is divided into two phases:
 1. **Ordering phase:** The neighborhood distance starts as the maximum distance between two neurons, and decreases to the tuning neighborhood distance. The learning rate starts at the ordering-phase learning rate and decreases until it reaches the tuning-phase learning rate. This phase typically allows the SOM to learn the *topology* of the input space.
 2. **Tuning Phase:** The neighborhood distance stays at the tuning neighborhood distance (i.e., typically 1.0). The learning rate continues to decrease from the tuning phase learning rate, but very slowly. The small neighborhood and slowly decreasing learning rate allows the SOM to learn the *distribution* of the input space. The number of epochs for this phase should be much larger than the number of steps in the ordering phase.

Types of Neural Network **TECHSOURCE**
www.techsource45.com.my

- The learning parameters for both phases of training are,

```
>> net.inputWeights{1,1}.learnParam  
ans =  
    order_lr: 0.9000  
    order_steps: 1000  
    tune_lr: 0.0200  
    tune_nd: 1
```
- Train the SOM for 1000 epochs with

```
>> net.trainParam.epochs = 1000;  
>> net = train(net, P);
```
- Superimpose the trained network structure onto the input space

```
>> plot(P(1,:), P(2,:), 'g.', 'markersize', 20), hold on  
>> plotsom(net.iw{1,1}, net.layers{1}.distances), hold off
```

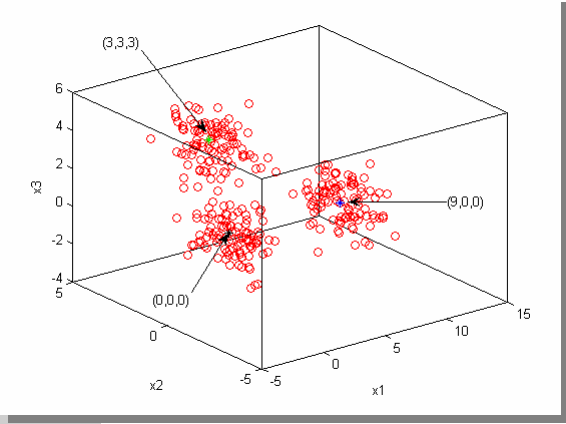

Try alter the size of the SOM and learning parameters and draw conclusion on how it affects the result.

Exercise 2: Mapping of Input Space

In this exercise we will test whether the SOM can map out the *topology* and *distribution* of an input space containing three clusters illustrated in the figure below,

©2005 TECHSOURCE Systems Sdn. Bhd.

Types of Neural Network **TECHSOURCE**
www.techsource.com.my

Solution:

```
% Let's start by creating the data for the input space illustrated previously
>> d1 = randn(3,100); % cluster center at (0, 0, 0)
>> d2 = randn(3, 100) + 3; % cluster center at (3, 3, 3)
>> d3 = randn(3,100), d3(1,:) = d3(1,:) + 9; % cluster center at (9, 0, 0)
>> d = [d1 d2 d3];

% Plot and show the generated clusters
>> plot3(d(1,:), d(2,:), d(3,:), 'ko'), hold on, box on

% Try to build a 10-by-10 SOM and train it for 1000 epochs,
>> net = newsom(minmax(d), [10 10]);
>> net.trainParam.epochs = 1000;
>> net = train(net, d);

% Superimpose the trained SOM's weights onto the input space,
>>(gcf, plotsom(net.IW{1,1}, net.layers{1}.distances), hold off

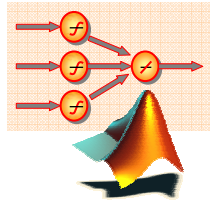

% Simulate SOM to get indices of neurons closest to input vectors
>> A = sim(net, d), A = vec2ind(A);
```

Predicting the Future Time Series Data

The demand for electricity (in MW) varies according to seasonal changes and weekday-weekend work cycle. How do we develop a neural-network based Decision-Support System to forecast the next-day hourly demand?

Note: NSW electricity demand data (1996 – 1998) courtesy of NEMMCO, Australia

Case Study

Solution:

Step 1: Formulating Inputs and Outputs of Neural Network

By analysing the time-series data, a 3-input and 1-output neural network is proposed to predict next-day hourly electricity demand,

Inputs:

$p1 = L(d,t)$
 $p2 = L(d,t) - L(d-1,t)$
 $p3 = Lm(d+1,t) - Lm(d,t)$

Output:

$a1 = L(d+1, t)$

Where,

- $L(d, t)$: Electricity demand for day, d, and hour, t
- $L(d+1, t)$: Electricity demand for next day, (d+1), and hour, t
- $L(d-1, t)$: Electricity demand for previous day, (d-1), and hour t
- $Lm(a, b) = \frac{1}{2} [L(a-k, b) + L(a-2k, b)]$
- k = 5 for Weekdays Model & k = 2 for Weekends Model

Case Study

Step 2: Pre-process Time Series Data to Appropriate Format

The time-series data is in MS Excel format and was date- and time-tagged. We need to preprocess the data according to following steps:

1. Read from the MS Excel file [[histDataIp.m](#)]
2. Divide the data into weekdays and weekends [[divideDay.m](#)]
3. Remove any outliers from the data [[outlierRemove.m](#)]

Step 3: Constructing Inputs and Output Data for Neural Network

Arrange the processed data in accordance to neural-network format:

1. Construct Input-Output pair [[nextDayIp.m](#)]
2. Normalizing the training data for faster learning [[processIp.m](#)]

Step 4: Training & Testing the Neural Network

Train the neural network using command-line or NNTOOL. When training is completed, proceed to test the robustness of the network against “unseen” data.

The End
